

FIVE DIABETES MYTHS AND MISCONCEPTIONS

*Did you know an estimated 8 to 9 million adults live with undiagnosed diabetes in South Africa? 50% of people with type 2 diabetes don't know they have it.**

The number of people with type 2 diabetes is increasing in every country. The World Health Organization predicts that diabetes will be the seventh leading cause of death worldwide in 2030.

As chances are good that you know someone who is pre-diabetic or who already has diabetes, clue yourself up by making sure you have knowledge and not assumptions.

HERE ARE FIVE COMMON, BUT WRONG, IDEAS ABOUT DIABETES:

TYPE 2 DIABETES IS 'NOT SO BAD'

A common myth about diabetes is that type 1 is the 'bad' kind of diabetes and that type 2 is the less serious or 'good' kind. It's not clear where this idea started, but it could be from our fear of needles. People with type 1 diabetes need insulin injections to control their blood sugar. People with type 2 diabetes can usually control their blood sugar with pills and lifestyle changes, or even by lifestyle changes alone.

However, some people with type 2 diabetes also have to inject themselves with insulin as diabetes can worsen over time. Both types of diabetes can lead to serious health complications such as heart disease, stroke, blindness, kidney failure, and nerve damage that can result in having to amputate limbs.

FIVE DIABETES MYTHS AND MISCONCEPTIONS

2 THIN PEOPLE CAN'T GET TYPE 2 DIABETES

Being overweight is a major risk factor for developing type 2 diabetes. Being even slightly overweight increases diabetes risk by up to five times, according to research done by Professor Walter Willett from the Harvard School of Public Health. Being seriously obese increases it 60 times.

But being overweight is not the only major risk factor for type 2 diabetes. Genetics are just as important. People with a family history of diabetes are at higher risk for both type 1 and type 2 diabetes. Smoking also increases the risk of diabetes and heart disease.

4 EATING SOMETHING REALLY SWEET WILL 'GIVE YOU' DIABETES

Type 1 diabetes is genetic, and type 2 is influenced by genetics and other factors. About 80% of type 2 diabetes cases are linked to lifestyle factors. But if you don't have diabetes and only eat something ridiculously sweet every now and then, the sugar won't automatically 'give you' diabetes.

This doesn't give you a free pass to eat sweets. The Diabetes Care journal research shows that people who had one to two soft drinks a day had a 26% greater risk of developing type 2 diabetes. This is in comparison to those who had no soft drinks or less than one a month.

3 PEOPLE WITH DIABETES MUST EAT SMALL, FREQUENT MEALS

If you have low blood sugar, you must eat frequently to keep your blood sugar stable. It's easy to assume that anyone with diabetes must eat small meals and snacks to keep them going. Unfortunately, it's not that simple.

Both high blood sugar (hyperglycaemia) and low blood sugar (hypoglycaemia) are common in people with diabetes. If there is too much glucose (sugar) in a person's blood, frequent snacking will only make the condition worse. Each person with diabetes must have their own eating plan that works for their body. This can involve anything from regular small meals to fasting.

5 YOU CAN'T GET TYPE 2 DIABETES IF YOU LEAD A HEALTHY LIFESTYLE

Since 80% of type 2 diabetes is triggered by lifestyle factors, it's easy to assume following a healthy eating plan and exercising regularly means you're immune. Unfortunately, there are other factors that can prevent the pancreas from producing enough insulin or prevent the body from responding to insulin normally.

Some medical conditions, such as polycystic ovarian syndrome (PCOS), increase the risk for type 2 diabetes because they are related to insulin resistance. In PCOS, cysts form in your ovaries, and one possible cause is insulin resistance. You could also develop diabetes if you are involved in an accident that damages your pancreas.

So don't rely on assumptions instead of facts. Use reliable sources for health information and ask your GP for help with managing medical conditions.
